

# Hub and Spoke Model of Care Delivery: NAVIFY® Tumor Board

## Introduction Hub-and-Spoke Model

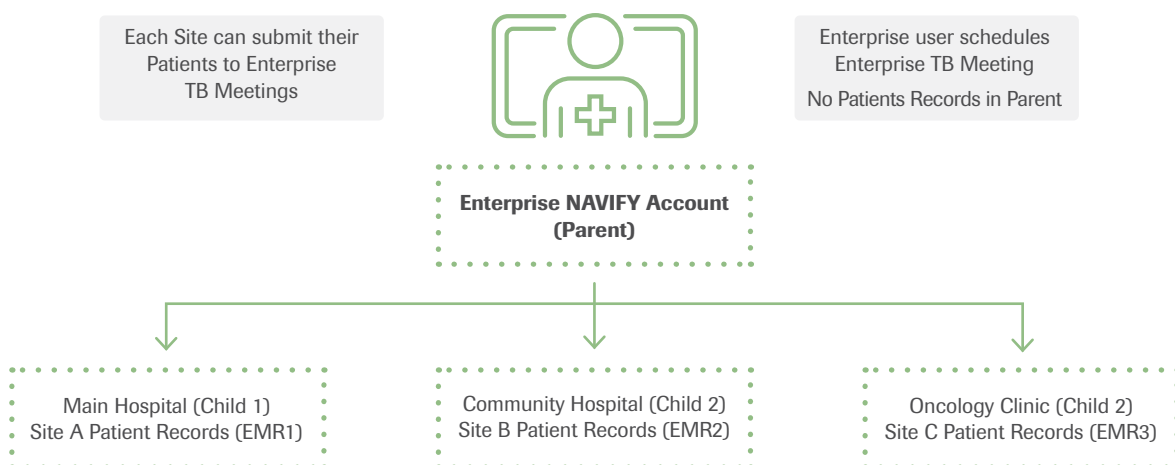

The hub-and-spoke organization design is a healthcare service delivery model that organizes care delivery locations into a networked environment that has an anchor location (the hub) with comprehensive care delivery services and several satellite locations (the spokes) that offer more limited services – patients that require more comprehensive care will either be routed to or receive remote care from the hub.

Reasons for this type of care delivery model are greater efficiency, as the hub-and-spoke model combines assets across the wide array of oncology services and, as a result, can clinically integrate and coordinate cancer care services, including rural areas.

## NAVIFY Hub-and-Spoke Deployment

An example 3-site configuration with Hub (enterprise view users, but no patient data entry) and Spokes (individual sites with local patients and local meetings):

### Enterprise (Parent-Child) Tumor Board Deployment

- Each facility only has access to their own patients
- Enterprise Accounts can be Shared Access accounts which will only allow them to see patients which they have been invited to (Parent or Child)

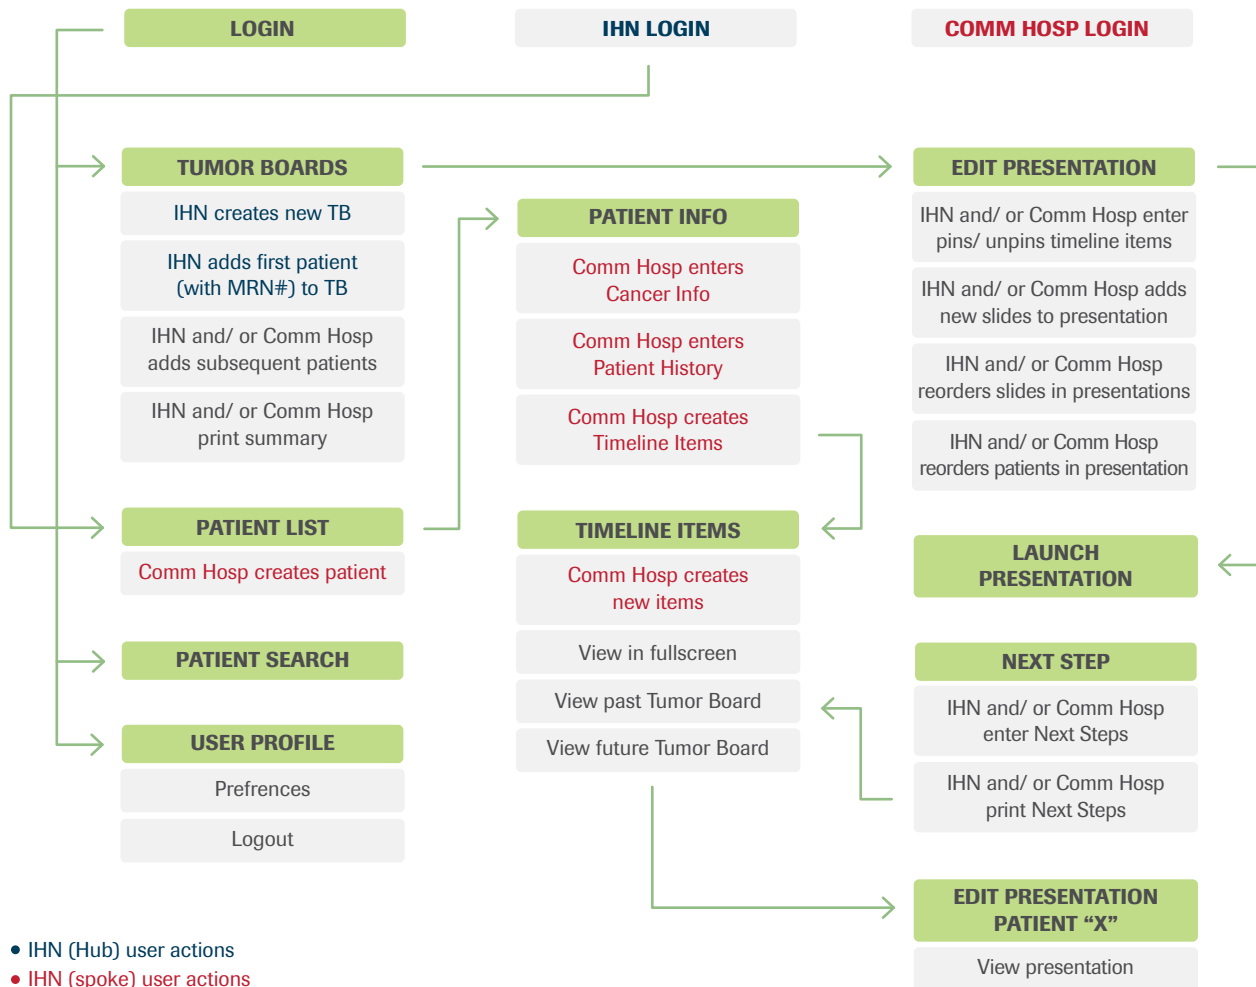

## NAVIFY Hub-and-Spoke Model

For NAVIFY Tumor Board customers, an enterprise hub-and-spoke model for tumor boards can be represented as follows:

- conduct local weekly tumor boards in each facility (the spokes) and monthly tumor boards at the enterprise location (the hub)
- conduct tumor board services at satellite locations (the spokes)

The graph below outlines a common tumor board workflow for a hub-and-spoke setup between an IHN and a community hospital.

## Summary

The changing healthcare environment constantly seeks to include technology advancements that allow organizations to optimize care delivery while containing costs. The hub-and-spoke model supports healthcare organizations in their goals to deliver cancer care without variance in the delivery process.
